Open Source Work

Node.js — Open Source Contributor

Jun 2026 – Aug 2026

- Fixed EventTarget weak-listener handling by storing listeners in per-key SafeSet collections and updating cleanup logic; [PR #64024](#) merged after maintainer review.
- Added 2 regression tests covering garbage collection and independent listener removal.

Projects

Eiga — Viewing-history visualizations

Next.js, TypeScript, D3.js

eiga.pages.dev

- Transformed Letterboxd exports into interactive visualizations across 5 dimensions, including watch date, rating, and decade; processed data entirely in the browser without accounts or server-side storage.
- Launched on Cloudflare Pages, where analytics recorded 4.01k total HTTP/HTTPS requests to eiga.pages.dev.

Feedback — HTTP load-testing CLI

Go

github.com/aryansaves/Feedback

- Developed a concurrent HTTP load-testing command-line interface (CLI) with configurable workers and round-robin request distribution across multiple endpoints.
- Measured Time to First Byte (TTFB) with Go's `httptest` and reported request failures and timing statistics; released cross-platform binaries through GitHub Releases.

Clockwork — Redis-compatible key-value store

Go

github.com/aryansaves/clockwork

- Implemented the Redis Serialization Protocol (RESP) over TCP using Go's standard library, enabling unmodified `redis-cli` and `redis-benchmark` clients to connect.
- Added string and list commands, time-to-live (TTL) expiration, and atomic SAVE persistence; coordinated concurrent clients with goroutines and `sync.RWMutex`.
- Benchmarked 100,000 requests with 50 concurrent clients and optimized LPUSH to amortized $O(1)$; distributed a Docker image and cross-platform binaries.

Kiroku — Media journal API and Telegram bot

TypeScript, Fastify, Bun

MVP: kiroku-j.vercel.app | github.com/aryansaves/kiroku-api

- Integrated Groq language-model parsing with a Telegram bot to turn messages into journal entries across 6 media categories, stored in MongoDB.
- Connected 4 metadata APIs for titles and cover images; cached search results in Redis for 6 hours to avoid repeated external lookups.
- Implemented Google OAuth 2.0 and Telegram sign-in, JSON Web Token (JWT) authentication, Redis-backed refresh tokens, and request validation with Zod.

Technical Skills

Languages: Go, TypeScript, JavaScript, SQL

Backend: Node.js, Bun, Fastify, REST APIs, OAuth 2.0, JWT, Zod

Databases: MongoDB, Mongoose, Redis

Frontend: React, Next.js, D3.js

Systems and testing: TCP/IP, concurrency, load testing, benchmarking, regression testing

Tools and cloud: Docker, Git, Linux, AWS, Cloudflare Pages

Education

KIET Deemed to be University

2024 – 2028

B.Tech in Computer Science and Engineering, specialization in Artificial Intelligence
